                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                망
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δĀ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents tumour necrosis factor receptor ("NWFR) TR5, also known as TRID or DcR1. The invention relates to TNFR related polypeptides TR1, TR3 and TR5 (see AAV05742-44) and their ligand TL3 (see AAV05745). TR1, TR3, TR5 and TL3 are used in claimed methods of identifying agonists and antagonists, i.e. compounds that bind to the receptors or ligand, and which activate (agonist) or inhibit activation of (antagonists) TR1, TR3, TR5 or TL3. A screening kit for identifying agonists, antagonists, or ligands, receptors, substrates, enzymes etc. for TR1, TR3, TR5 or TL3 polypeptides is provided. The agonists and antagonists are useful for treatment of chronic and acute inflammation, arthritis, septicaemia, autoimmune disease e.g. inflammatory bowel disease, psoriasis, transplant rejection, graft versus host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, restenosis, brain injury, AIDS, bone diseases, cancer (e.g. lymphoproliferative disorders), atherosclerosis and Alzheimer's disease, etc., caused by imbalance of TR1, TR3, TR5 or TL3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                            autoimmune disease; viral infection; degenerative disorder; amyotrophic lateral sclerosis; retinitis pigmentosa; ischae cerebellar degeneration; myelodysplastic syndrome.

CC This sequence is the human TRAIL receptor TRAIL-R3 of the invention. An CC antibody against the TRAIL receptors is useful for detecting mammalian CC DR5 or TRAIL-R3 proteins in a sample. Recombinant cells are useful in CC bioassays for screening for (antiagonists of DR5 or TRAIL-R3 proteins. CC (Antiagonists identified by the assay are useful for modulating the CC apoptotic activity mediated by DR5 or TRAIL-R3 proteins. Apoptosis CC (e.g. lymphomas and carcinomas), autoimmune diseases (e.g. systemic lupus CC (e.g. lymphomas and carcinomas), autoimmune diseases (e.g. systemic lupus CC (e.g. herpes virus, poxvirus and adenovirus), degenerative disorders CC (e.g. Alzheimer's disease and Parkinson's disease), amyotrophic lateral CC (e.g. Alzheimer's disease and Parkinson's disease), amyotrophic lateral CC syndromes (e.g. aplastic anaemia) and ischaemic injury (e.g. myocardial CC infarction and stroke). The polynucleotides can also be used to treat these diseases. Antisense oligonucleotides to the DNA sequences can be used to form a composition that is useful for inhibiting expression of a human DR5 or TRAIL-R3 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is human tumour necrosis factor (TRR)-related apoptosis-inducing ligand (TRAIL) binding protein (BP). TRAIL-BP can be used for inhibiting the biological activities of TRAIL or for purifying TRAIL. TRAIL-BP proteins can be used for treating a TRAIL-mediated disorder such as T cell death in HIV-infected patients. They can be used for treating thrombotic microangiopathies such as thrombotic thrombocytopenic purpura, haemolytic-uraemic syndrome, clotting of small blood vessels or systemic lupus erythematosus. The TRAIL-BP nucleic acids can also be used for gene therapy. They can also be used as

This polypeptide comprises human Apo-2DcR, a novel member of the tumour necrosis factor receptor family that binds to Apo-2 ligand. Its amino acid sequence was deduced from the nucleotide sequence of an isolated cDNA clone (see AAV84347); an alternative translation
                                        Claim
                                                       New Apo-2DcR polypeptide - used for apoptosis, e.g. in neurodegeneration
                                                                              WPI; 1999-095340/08

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  C initiation site in this clone will encode a polypeptide (see AAW88408) lacking the first 40 amino acid residues of this sequence. C Apo-2DcR shows more sequence identity to DR4 (60%) and Apo-2 (50%) than to other apoptosis-linked receptors. The polypeptide can be CC ATCC 209087. The invention provides vectors and host cells for CC recombinant production of Apo-2DcR polypeptides, antibodies, and CC transgenic and knockout animals (useful e.g. for screening and CC developing drugs that protect against excessive apoptosis). Apo-2DcR, or chimeras comprising Apo-2DcR or its (claimed) CC extracellular domain fused to a heterologous polypeptide are used CC to modulate apoptosis of mammalian cells (claimed) and/or NF-kappaB CC extracellular apoptosis of mammalian cells (claimed) and/or NF-kappaB CC activation by Apo-2 ligand, and may be expressed in vivo or ex vivo CC for gene therapy. They can be used in methods for the modulation CC and diagnosis of apoptosis e.g. in cases of neurodegeneration, CC antoimmune diseases and inflammation. Most human tumour cells do CC not express Apo-2DcR transcripts, but normal tissues do, suggesting CC that Apo-2DcR may permit selective killing of cancer cells by Apo-2 creating normal, but not cancerous, cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The polypeptide is also useful for modulating apoptosis and useful in treatment of conditions associated with abnormal physiology or development, such as cancer or degenerative conditions and for regulation of viral infection and replication. At least five different death receptors are known, which include the CD95 (Fas/APO-1), the TNF receptor-6 (DR-6), and TNF-related protein (TRAMP), death receptor-6 (DR-6), and TNF-related apoptosis-inducing ligand (TRAIL) receptors 1, 2 and 4.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC This invention describes isolated Tumor Necrosis Factor (TNF) family CC receptor polypeptides: APO4, APO6, APO8 and APO9 or their active CC fragments, and isolated TNF related ligands I and 3 (TNRL1 and TNRL3) or CC their active fragments. APO4 is useful for diagnosing prostate cancer CC by determining levels of APO4 in an individual. Prostate cancer can also be treated using APO4 selective binding agents linked to a therapeutic CC molety. APO4 polypeptides are also useful for identifying selective CC binding agents, useful in diagnosis/treatment of disease by binding of CC agents to the polypeptide/active fragment which is extracellular, or CC expressed on the cell surface. The binding is preferably performed in CC vivo. APO4 polypeptides/ active fragments are also useful for screening CC arguments and antagonists by binding and observing the changer in APO4 activity. Effective pharmacological agents useful in diagnosis or treatment of disease are also identified using APO4 polypeptides/active considerative fragments and APO4 signal transducer molecules that specifically interact with a cytoplasmic domain of APO4 and detecting a change in level of APO4 activity. The method is performed in vitro. APO9 polypeptides are also identified using a change in level of APO4 care all useful as immunogens for preparing antibodies. APO4 is also useful for diagnosis/treatment of developmental or gestational abnormalities. APO8 was transfected to human breast carcinoma cell line
                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

```

```
a putative glycosylphosphatidylinositol-anchored protein, which is ceither cell-associated or processed and secreted. Secreted TRAIL-R3 competes for the binding of TRAIL to TRAIL-R1 and/or TRAIL-R2, thereby acting as an inhibitor of apoptosis. Expression of TRAIL-R3 is restricted to peripheral blood lymphocytes and skeletal muscle. It is likely that TRAIL-3 acts as an important regulator of TRAIL-R2 and -R3 induced cell death in vivo. A method for preventing or reducing the advancement, severity or effects of an immunological disease involves administering a TRAIL-R2 or TRAIL-R3 blocking agent such as a soluble TRAIL-R (preferably comprising a human immunoglobulin Fc domain) and an antibody. A method of treating cancer involves administration of antibodies against TRAIL-R3 or TRAIL-R2. A method of inducing cell death involves administration of an agent capable of inhibiting the binding of TRAIL-R2 or -R3 to its ligand.

TRAIL-3 is highly glycosylated.

apoptosis-mediating surface antigen Fas precursor -human N;Alternate names: surface antigen APO-1 C;Species: Homo sapiens (man) C;Date: 17-Jan-1992 #sequence_revision 17-Jan-1992 #text_change 21-Jul-2000 C;Accession: A40036; S24543; A38142 R;Itoh, N.; Yonehara, S.; Ishii, A.; Yonehara, M.; Mizushima, S.I.; Sameshir
              A; Molecule type: nucleic acid
A; Residues: 1-134, 'Q', 136-335 <OEH>
A; Experimental source: SKM6.4 cells
A; Note: sequence extracted from NCBI backbone (NCBIP:103810)
A; Note: in NCBI backbone the source is designated as mouse

FUNCTION: Receptor for the cytotoxic ligand TRAIL. Contains truncated death domain and hence is not capable of inducing apoptosis but protects against TRAIL-mediated apoptosis. Regare contradictory with regards to its ability to induce the are contradictory with regards to ref.1 it cannot but according

                                                                                                                                                                                                                                                                                                                  SIMILARITY: CONTAINS 2 THER-CYS REPEATS SIMILARITY: CONTAINS 1 DEATH DOMAIN.
                                                                                                                                                                                                                                                                                                                                                       factor kappaB-pathway and can bind the cytoplasmic ada molecule FADD/MORTI which engages initiator caspases s caspase 8 leading to subsequent activation of effector that execute apoptotic death of the cell.

SUBUNIT: Can interact with TRADD and RIP.
SUBCELULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Widely expressed. High levels are spleen, peripheral blood leukocytes, small intestine a but also in K562 erythroleukemia cells, MCF7 breast cacells and activated T-cells.
                                                                                                                                                                                                                                                      s SWISS-PROT entry is copyright. -ITISSUE SPECIFICITY: Widely expressed in adult and fetal tissues; very highly expressed in tumor cell lines such as HeLa 53, K562, HL-60, SW480, A549 and G361; highly expressed in heart, peripheral blood lymphocytes, liver, pancreas, spleen, thymus, prostate, ovary, uterus, placenta, testis, esophagus, stomach and throughout the intestinal tract; not detectable in brain.

-I DISEASE: Defects in TWFRSF10B may be a cause of squamous cell carcinoma of the head and neck.

-I SIMILARITY: CONTAINS 1 DEATH DOMAIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: Receptor for the cytotoxic ligand TRAIL; mediates apoptosis in a caspase-dependent manner. Can trigger the nuclear factor kappaB-pathway and can bind the cytoplasmic adapter molecule FADD/MORTI which engages initiator caspases such as caspase 8 leading to subsequent activation of effector caspathat execute apoptotic death of the cell.

SUBUNIT: Homotrimer (Potential). Can interact with TRADD and SUBCELLULAR LOCATION: Type I membrane protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- FUNCTION: RECEPTOR FOR A CYTOKINE LIGAND KNOWN AS FASL. THE ADAPTOR MOLECULE FADD RECRUITS CASPASE-8 TO THE ACTIVATED RECEPTOR. THE RESULTING AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC) PERFORMS CASPASE-8 PROTECLYTIC ACTIVATION. ACTIVE CASPASE-8 INITIATES THE SUBSEQUENT CASCADE OF CASPASES (ASPARTATE-SPECIFIC CYSTEINE PROTEASES) MEDIATING APOPTOSIS. FAS-MEDIATED APOPTOSIS MAY HAVE A ROLE IN THE INDUCTION OF PERLPHERAL TOLERANCE, IN THE ANTICEN-STIMULATED SUICIDE OF MATURE T-CELLS, OR BOTH (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- DOMAIN: CONTAINS A DEATH DOMAIN INVOLVED IN THE BINDING OF FADD, AND MAYBE TO OTHER CYTOSOLIC ADAPTOR PROTEINS.
-!- SIMILARITY: CONTAINS 3 TMFR-CYS REPEATS.

                                                                                                                                                                                                                                                                                Pfam;
Pfam;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RECRUITS CASPASE-8 TO THE ACTIVATED RECEPTOR. THE RESULTING AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC) PERFORMS CASPASE-8 PROTEOLYTIC ACTIVATION WHICH HINTATES THE SUBSEQUENT CASCADE OF CASPASES (ASPARTATE-SPECIFIC CYSTEINE PROTEASES) MEDIATING APOPTOSIS (BY SIMILARITY).

-I- SUBUNIT: THE BINDING TO THE EXTRACELLULAR DOMAIN OF THEFI LEADS TO HOMOTRIMERIZATION. ONCE AGGREGATED THE RECEPTORS DEATH DOMAINS PROVIDE A NOVEL MOLECULAR INTERFACE THAT INTERACTS SPECIFICALLY WITH THE DEATH DOMAIN OF TRADD. VARIOUS TRADD-INTERACTING PROTEINS SUCH AS TRAFES, RIP AND POSSIBLY FADD, ARE RECRUITED TO THEFI COMPLEX BY THEIR ASSOCIATION WITH TRADD. THIS COMPLEX ACTIVATES AT LEAST TWO DISTINCT SIGNALING CASCADES, APOPTOSIS AND ME-KAPPA B SIGNALING (BY SIMILARITY).

-I- SUBCELLULAR LOCATION: Type I membrane protein.

-I- SIMILARITY: CONTAINS 1 DEATH DOMAIN.

ACTIVE CASPASE-8 INITIATES THE SUBSEQUENT CASCADE CASPASES (ASPARTATE-SPECIFIC CYSTEINE PROTEASES) MEDIATING APOPTOSIS. FAS-MEDIATED APOPTOSIS MAY HAVE A ROLE IN THE INDUCTION OF PERIPHERAL TOLERANCE, IN THE ANTIGEN-STIMULATED SUICIDE OF MATURE T-CELLS, OR BOTH (BY SIMILARITY).

SUBCELLULAR LOCATION: Type I membrane protein.

DOMAIN: CONTAINS A DEATH DOMAIN INVOLVED IN THE BINDING OF FAD AND MAYBE TO OTHER CYTOSOLIC ADAPTOR PROTEINS.

SIMILARITY: CONTAINS 3 TNFR-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ween the Swiss Institute of Bioinforms

CAN MEDIATE CELL SURVIVAL AS WELL AS CELL DEATH (NEURAL CELLS (By Similarity).
-I- SUBUNIT: CAN FORM A HOMODIMER THROUGH DISULFIDE BOND FORMA:
-I- SUBCELLULAR LOCATION: Type I membrane protein.
-I- PTM: N- AND O-GLYCOSYLATED AND IS PHOSPHORYLATED ON SERINE
-I- SIMILARITY: CONTAINS 4 TWER-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE-90152140; PubMed-2154393;

C-1- FUNCTION: RECEPTOR FOR TWE-ALPHA. THE ADAPTOR MOLECULE FADD RECEPTOR. THE RESULTING RECEPTOR. TRE RESULTING RECEPTOR. THE RESULTING AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC) PERFORMS CASPASE-8 PROTECLYTIC ACTYVATION WHICH INITIATES THE SUBSEQUENT CASCADE OF CASPASES (ASPARTA-SPECIFIC CYSTEINE PROTEASES) MEDIATING APOPTOSIS (BY SIMILARITY).

C-1- SUBUNIT: THE BINDING TO THE EXTRACELLULAR DOMAIN OF TNERL LEADS TO DEATH DOMAIN OF TRADE THE RECEPTORS DEATH DOMAINS PROVIDE A NOVEL MOLECULAR INTERFACE THAT INTERACTS SPECIFICALLY WITH THE DEATH DOMAIN OF TRADD. VARIOUS TRADD-INTERACTING PROTEINS SUCH AS TRAPS, RIP AND POSSTBLY FADD, ARE RECUTTED TO THERE CASPASE AT LEAST TWO DISTINCT SIGNALING CASCADES, APOPTOSIS AND CONFIRM BRIGHTON. TYPE I MEMBERADE THIS COMPLEX BY THEIR ASSOCIATION WITH TRADD. THIS COMPLEX OF THE SUBCELLULAR LOCATION: TYPE I MEMBERADE PROTESIS AND CONFIRM BRIGHTON. TYPE I SUBCELLULAR LOCATION: TYPE I SUBCELULAR LOCAT
